1 Objectives

After performing this lab, students shall be able to understand the following Python concepts and applications:

- ✓ Matplotlib Introduction
- ✔ Application of Matplotlib
- ✓ Min-Max Algorithm (Game theory)

2 Task Distribution

Total Time	170 Minutes
Matplotlib Introduction/Installation Guide	20 Minutes
Application of Matplotlib	25 Minutes
Min-Max Algorithm	25 Minutes
Exercise	90 Minutes
Online Submission	10 Minutes

3 Matplotlib

Matplotlib is a low-level graph plotting library in python that serves as a visualization utility. Matplotlib was created by John D. Hunter. Matplotlib is open source and we can use it freely. Matplotlib is mostly written in python, a few segments are written in C, Objective-C and JavaScript for Platform compatibility.

3.1 Installation of Matplotlib

If you have Python and PIP already installed on a system, then installation of Matplotlib is very easy.

Install it using this command:

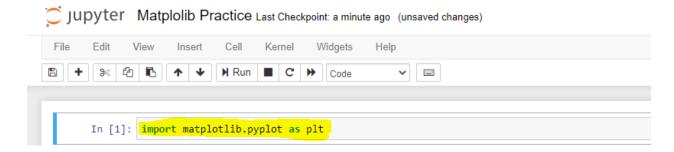

C:\Users\Your Name>pip install matplotlib

pip install matplotlib

But mostly distribution like Anaconda, Spyder has pre-installed matplotlib.

3.2 Pyplot

Most of the Matplotlib utilities lies under the pyplot submodule, and are usually imported under the plt alias:

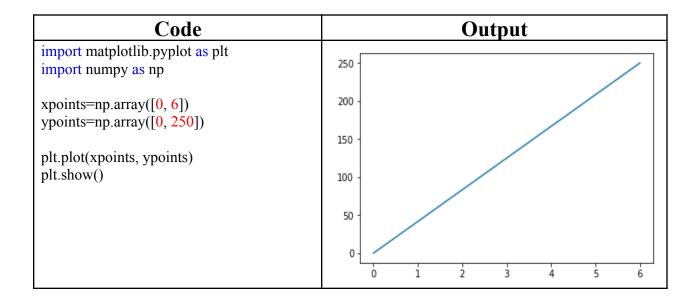

import matplotlib.pyplot as plt

Now the Pyplot package can be referred to as plt.

Example

Draw a line in a diagram from position (0,0) to position (6,250):

3.3 Plotting x and y points

The plot() function is used to draw points (markers) in a diagram.

By default, the plot() function draws a line from point to point.

The function takes parameters for specifying points in the diagram.

Parameter 1 is an array containing the points on the **x-axis**.

Parameter 2 is an array containing the points on the y-axis.

If we need to plot a line from (1, 3) to (8, 10), we have to pass two arrays [1, 8] and [3, 10] to the plot function.

Example

Draw a line in a diagram from position (1, 3) to position (8, 10):

Code	Output
<pre>import matplotlib.pyplot as plt import numpy as np xpoints = np.array([1, 8]) ypoints = np.array([3, 10]) plt.plot(xpoints, ypoints) plt.show()</pre>	10 - 9 - 8 - 7 - 6 - 5 - 4 - 3 - 4 - 5 - 6 - 7 - 8

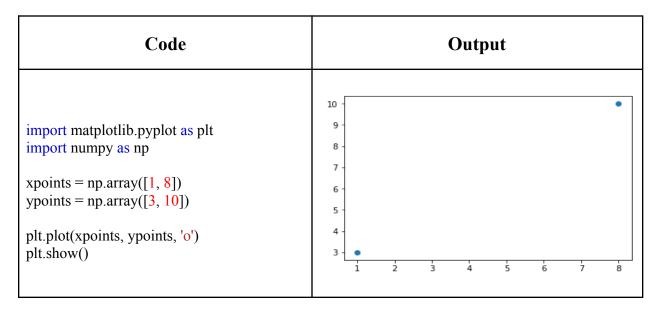

There are many types of single lines/multiple lines that can be drawn, explore other types at: https://www.w3schools.com/python/matplotlib_line.asp

3.4 Plotting Without Line

To plot only the markers, you can use shortcut string notation parameter 'o', which means 'rings'.

Example

Draw two points in the diagram, one at position (1, 3) and one in position (8, 10):

There can be different type of markers, you can explore at: https://www.w3schools.com/python/matplotlib markers.asp

3.5 Multiple Points

You can plot as many points as you like, just make sure you have the same number of points in both axis.

Example

Draw a line in a diagram from position (1, 3) to (2, 8) then to (6, 1) and finally to position (8, 10):

Code	Output
------	--------

```
import matplotlib.pyplot as plt import numpy as np

xpoints = np.array([1, 2, 6, 8]) ypoints = np.array([3, 8, 1, 10])

plt.plot(xpoints, ypoints) plt.show()
```

3.6 Default X-Points

If we do not specify the points in the x-axis, they will get the default values 0, 1, 2, 3, (etc. depending on the length of the y-points.

So, if we take the same example as above, and leave out the x-points, the diagram will look like this:

Example

Plotting without x-points:

Code	Output
<pre>import matplotlib.pyplot as plt import numpy as np ypoints = np.array([3, 8, 1, 10, 5, 7]) plt.plot(ypoints) plt.show()</pre>	10 -

The x-points in the example above are [0, 1, 2, 3, 4, 5] by default.

3.7 Create Labels and title for a Plot

With Pyplot, you can use the xlabel() and ylabel() functions to set a label for the x- and y-axis.

Example

Add labels to the x- and y-axis:

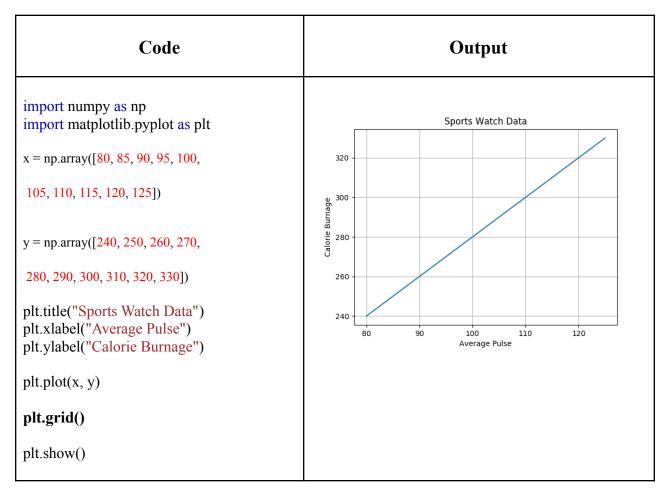

Code	Output
import numpy as np import matplotlib.pyplot as plt x = np.array([80, 85, 90, 95, 100,105, 110, 115, 120, 125]) y = np.array([240, 250, 260, 270, 280, 290, 300, 310, 320, 330])	Sports Watch Data 320 - 8 300 - 260 -
plt.plot(x, y) plt.title("Sports Watch Data") plt.xlabel("Average Pulse") plt.ylabel("Calorie Burnage") plt.show()	240 - 80 90 100 110 120 Average Pulse

3.8 Add Grid Lines to a Plot

With Pyplot, you can use the grid() function to add grid lines to the plot.

Example

Add grid lines to the plot:

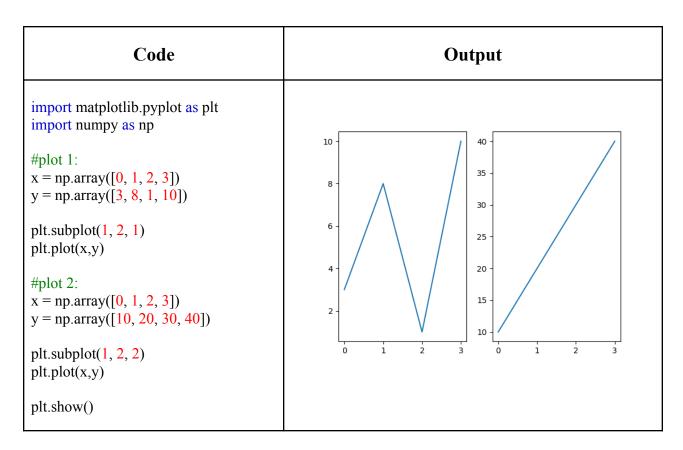

Different type of grid can be generated, for more details see: https://www.w3schools.com/python/matplotlib_grid.asp

3.9 Display Multiple Plots

With the subplots() function you can draw multiple plots in one figure:

Example

Draw 2 plots:

There different ways to plot multiple plots: https://www.w3schools.com/python/matplotlib subplots.asp

3.10 Creating Scatter Plots

With Pyplot, you can use the scatter() function to draw a scatter plot.

The scatter() function plots one dot for each observation. It needs two arrays of the same length, one for the values of the x-axis, and one for values on the y-axis:

Example:

Code	Output
import matplotlib.pyplot as plt import numpy as np x=np.array([5,7,8,7,2,17,2,9, 4,11,12,9,6])	110 - 105 - 100 -
y=np.array([99,86,87,88,111, 86,103,87,94,78,77,85,86]) plt.scatter(x,y) plt.show()	95 - 90 - 85 - 80 - 2 4 6 8 10 12 14 16

Explanation of above plot:

The observation in the example above is the result of 13 cars passing by. The X-axis shows how old the car is. The Y-axis shows the speed of the car when it passes. Are there any relationships between the observations? It seems that the newer the car, the faster it drives, but that could be a coincidence, after all we only registered 13 cars.

There are different type of scatter graphs that can be created (kindly see the link given, as all examples will make the manual lengthy):

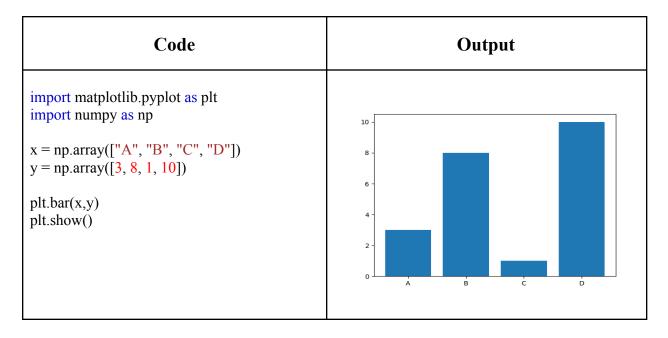

https://www.w3schools.com/python/matplotlib_scatter.asp

3.11 Creating Bars

With Pyplot, you can use the bar() function to draw bar graphs:

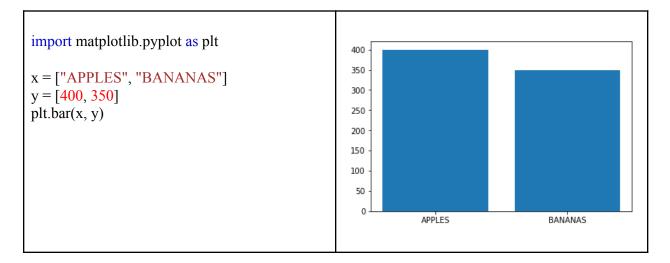

Example

Draw 4 bars:

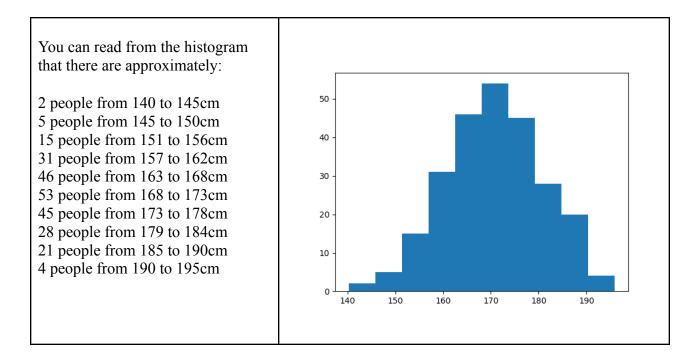

The bar() function takes arguments that describes the layout of the bars.

The categories and their values represented by the *first* and *second* argument as arrays.

3.12 Histogram

A histogram is a graph showing *frequency* distributions. It is a graph showing the number of observations within each given interval. Example: Say you ask for the height of 250 people; you might end up with a histogram like this:

3.12.1 Create Histogram

In Matplotlib, we use the hist() function to create histograms.

The hist() function will use an array of numbers to create a histogram, the array is sent into the function as an argument. For simplicity we use NumPy to randomly generate an array with 250 values, where the values will concentrate around 170, and the standard deviation is 10.

Code	Output
<pre>import matplotlib.pyplot as plt import numpy as np x = np.random.normal(170, 10, 250) plt.hist(x) plt.show()</pre>	60 - 50 - 40 - 30 - 20 - 10 - 150 160 170 180 190

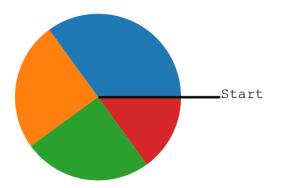

3.13 Creating Pie Charts

With Pyplot, you can use the pie() function to draw pie charts:

Code	Output
<pre>import matplotlib.pyplot as plt import numpy as np y = np.array([35, 25, 25, 15]) mylabels = ["Apples","Bananas","Cherries","Dates"] plt.pie(y, labels = mylabels) plt.legend() plt.show()</pre>	Apples Bananas Cherries Dates Cherries Cherries

As you can see the pie chart draws one piece (called a wedge) for each value in the array (in this case [35, 25, 25, 15]).

By default, the plotting of the first wedge starts from the x-axis and move *counterclockwise*:

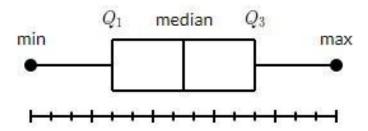

Note: The size of each wedge is determined by comparing the value with all the other values, by using this formula:

The value divided by the sum of all values: x/sum(x)

3.14 Box Plot

A box plot which is also known as a whisker plot displays a summary of a set of data containing the minimum, first quartile, median, third quartile, and maximum. In a box plot, we draw a box from the first quartile to the third quartile. A vertical line goes through the box at the median. The whiskers go from each quartile to the minimum or maximum.

The image is taken from: https://www.tutorialspoint.com/matplotlib/matplotlib box plot.htm

Example 1: Draw a box-and-whisker plot for the data set {3, 7, 8, 5, 12, 14, 21, 13, 18}.

Minimum: 3, Q_1 : 6, Median: 12, Q_3 : 16, and Maximum: 21.

Code	Output
import matplotlib.pyplot as plt	
data = [3, 7, 8, 5, 12, 14, 21, 13, 18]	20.0 -
plt.boxplot(data)	17.5 - 15.0 -
plt.show()	12.5 -
	7.5 -
	2.5 -
